

ABSTRACT

The present invention relates to a device for transporting persons along a staircase, comprising:

- a frame displaceable along a guide,
- a drive to be selectively set into operation for
5 displacing the frame along the guide; and
- a chair on the frame on which a person for transporting can be seated. The seat can comprise a seat part and a back rest and optionally at least one arm rest, wherein at least the seat part on the side directed
10 toward the back rest can be pivoted up and downward in a pivoting movement on a horizontal pivot axis and forms a guide during standing up or sitting down.
